

Name: Messiahlyn Mae G. Mabilangan
Course, Year & Section: BSIT 4-2

Student Number: 202201860
Date: September 16, 2026

ONLINE ACTIVITY #2
Personalized Linux, and Git Cheat Sheet

Using any available resources (official Git documentation, online tutorials, or the built-in git --help command), research the following topics and create a personalized 1-page (A4) cheat sheet:

1. Basic Linux commands (command, sample usage) (at least 10)

Command	Sample Usage	Description
mkdir	mkdir directory_name	create a new folder
cd	cd directory_name	change the current directory
rmdir	rmdir directory_name	delete empty directories
cat	cat file_name	display file contents and combine multiple files
cp	cp source destination	copy files or directories
mv	mv old_name new_name	move or rename files and directories
rm	rm file_name	delete files permanently
touch	touch file_name	create empty files and updates file timestamps
echo	echo "text"	display text in the terminal
ls	ls	list directory contents

2. Basic Git commands (command, sample usage, description (use your own wordings), common options/flags

git init	git restore
git status	git branch
git add	git checkout / git switch
git commit	git merge
git log	git tag
git diff	git clone

Command	Sample Usage	Description
git init	git init	to start a new repository or initialize an existing repository
git status	git status	to show the current state of files in working directory
git add	git add <file>	to add a file for next commit stage
git commit	git commit -m "message"	to make a save point for your project's file

Command	Sample Usage	Description
git log	git log	to view history of all commits in the repository or branch
git diff	git diff	to differentiate and show changes between different versions of files or project states
git restore	git restore	to undo uncommitted changes to files in working directory
git branch	git branch	to make a separate workspace without affecting the main project
git checkout/ git switch	git checkout <name> git switch <name>	to switch to another branch
git merge	git merge <branch>	to combine changes from one branch to another branch
git tag	git tag <tagname>	to bookmark or label a specific commit
git clone	git clone <url>	to clone or make an identical copy of a repository

2. the three-tree architecture of Git

The Git three-tree architecture is the Working Directory, Stage Area (Index), and the Repository. The Working Directory is the directory on the computer where the user makes changes. The Staging Area (Index) is an intermediate area where Git tracks changes that will go into the next commit. The Repository is where Git permanently stores all snapshots and change history.
